Benchmark Photos

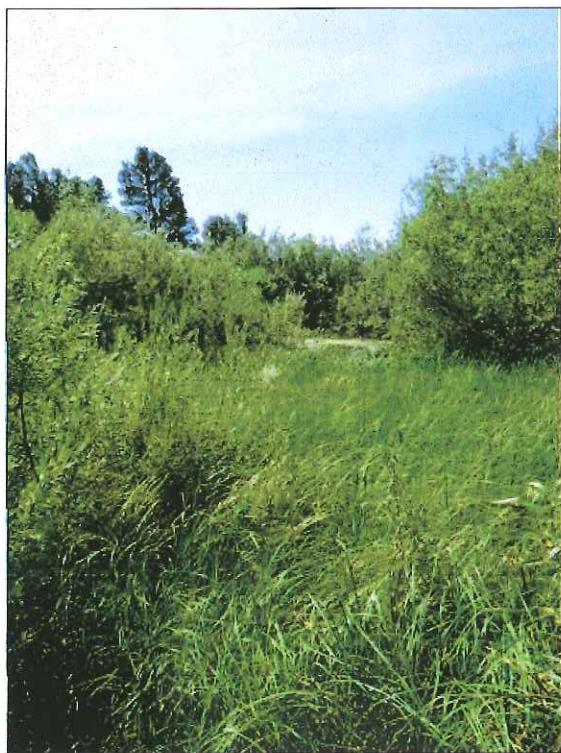

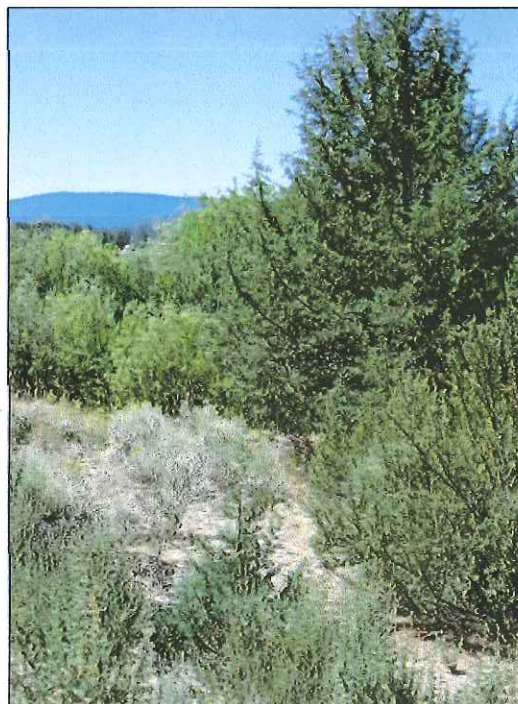

Photo 1 taken June 2009, shows McCreedy Springs. The channel has filled with sediment and vegetation. This channel will be cleaned out by KWP in 2010 to restore spring flows to the Sprague River. This work has been funded by the EPA.

Photo 2 shows juniper trees that have encroached in the uplands. Some ponderosa pine trees are visible in this photo. These trees will be thinned with this project.

Photos 3 and 4 show the juniper trees encroaching into McCreedy Springs. These trees would be removed with this project.
